

Monitoring a Coral

Date 2026

Medium Arduino, recycled cardboard, tape, paper

Size 15 × 15 × 30 cm

A small sculptural monitoring station that asks where the boundary of the monitorable lies. As sensors, screens and algorithms translate nature into data, the work questions whether control and detection become a form of intimacy, and whether what we approach is the world or only its simulation. Published in Vision Magazine; exhibited at Brown University (May 2026) and at the RISD CTC major exhibition (October 2026).

Paver Design

Date 2026

Medium Recycled HDPE plastic (~30%) and sand (~70%); product design

Interlocking, permeable paving bricks made from discarded HDPE: dining-hall bottles from the University of Rhode Island and ghost fishing gear recovered from local waters. The forms draw on the two-dimensional geometry of HDPE's molecular structure, resolved into three interlocking patterns. Central openings let water pass through, and the smaller bricks can be recolored. Developed with URI and the RISD Edna Lawrence Nature Lab.

Monster

Date 2025

Medium 3D modeling, digital render

A creature caught mid-leap over a dusk landscape, modeled and rendered in 3D. Its long tail curls into a taiji-and-bagua sphere, mixing a rat-like animal body with symbols of Chinese cosmology. Rendered in reflective, glitch-eroded chrome and in a rough, hatched black-and-white study.
